98. Validate Binary Search Tree

Solved

Medium | Topics | Companies

Given the `root` of a binary tree, *determine if it is a valid binary search tree (BST).*

A **valid BST** is defined as follows:

- The left subtree of a node contains only nodes with keys **strictly less than** the node's key.
- The right subtree of a node contains only nodes with keys **strictly greater than** the node's key.
- Both the left and right subtrees must also be binary search trees.

Example 1:

18.4K | 373 | 189 Online

Code

Java | Auto

```java
class Solution {
    public boolean helper(TreeNode root, TreeNode min, TreeNode max){
        if(root == null){
            return true;
        }
        if(min != null && root.val <= min.val){
            return false;
        }
        if(max != null && root.val >= max.val){
            return false;
        }
        return helper(root.left, min, root) && helper(root.right, root, max);
    }
    public boolean isValidBST(TreeNode root) {
        return helper(root, null, null);
```

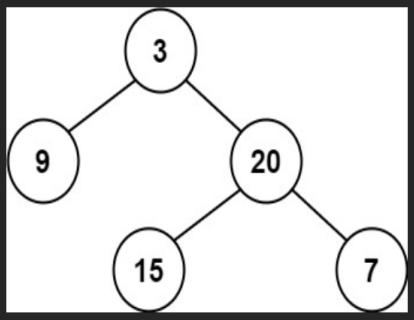
110. Balanced Binary Tree

Solved

Easy | Topics | Companies

Given a binary tree, determine if it is **height-balanced**.

Example 1:



12.2K | 283 | 139 Online

Code

Java | Auto

```java
class Solution {
    public int getheight(TreeNode root){
        if(root == null){
            return -1;
        }
        int hl = getheight(root.left);
        int hr = getheight(root.right);
        int max = hl < hr ? hr : hl;
        return max+1;
    }
    public boolean isBalanced(TreeNode root) {
        if(root == null){
            return true;
        }
        int bal = getheight(root.left) - getheight(root.right);
```
